

ABSTRACT OF THE DISCLOSURE

An automated Web security analysis system and process  
20 identifies security vulnerabilities in a target Internet Web  
site by parsing through the target Web site to search for a  
predetermined list of common security vulnerabilities. The  
process is recursive, exploiting information gathered  
throughout the process to search for additional security  
25 vulnerabilities. A prioritized list of detected security  
vulnerabilities is then presented to a user, including  
preferably a list of recommendations to eliminate the detected  
security vulnerabilities.
